Life cycle of a turkey: answer key

A wild turkey grows in four stages. Its eggs hatch about a month after the hen starts to sit on them.

Egg

A hen makes a shallow nest on the ground and lays about 10 to 14 eggs over several days. Then she sits on them for about a month.

Poult

The young, called poults, hatch covered in down and can leave the nest within a day. For their first month they eat mostly insects.

Young turkey

The poults grow through the summer with the hen, who raises them alone. Besides insects they eat seeds and berries, and in fall seeds, grain and acorns.

Turkey

Turkeys flock together in winter. In spring the males, called toms, gobble and strut, spreading their tails like a fan to attract the females.

From the Missouri Department of Conservation, “Wild Turkey”. The drawings are not to scale.
